

Uchigashima Documentation August 2016

Changes made in the github MSPN table

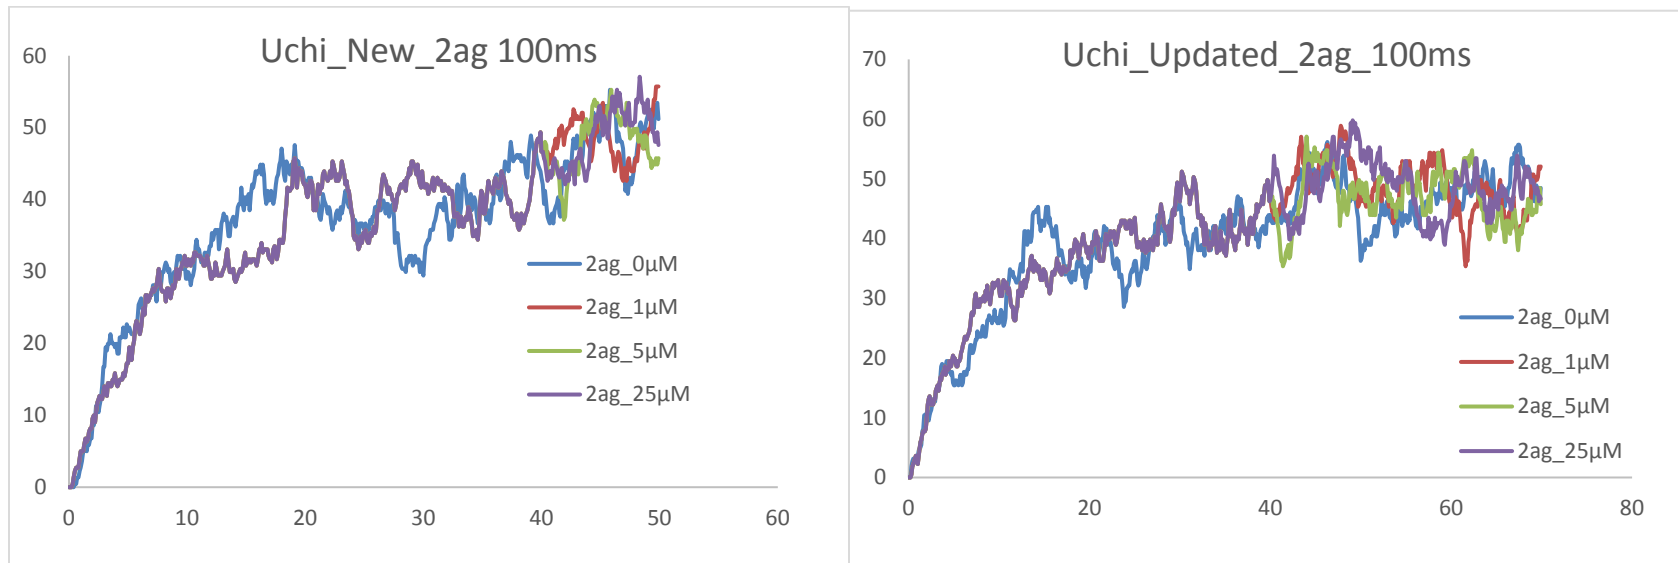

Reactions	Github rates (New MSPN table)					Updated			
	kf (nM ⁻¹ s ⁻¹)	kb (s ⁻¹)	kcat (s ⁻¹)	Kd or Km (nM)		kf (nM ⁻¹ s ⁻¹)	kb (s ⁻¹)	kcat (s ⁻¹)	Kd or Km (nM)
Gqabg + GluMglu \rightleftharpoons GqabgGluMglu \Rightarrow GqaGTP + GluMglu	0.0015	0.68	0.5	453.33		0.0075	3.39	2.5	786.66
PlcCa + GqaGTP \rightleftharpoons PlcCa-GqaGTP \rightarrow PlcCa+GaqGDP	0.0035	0.7	12	200		0.0175	51.49	12	3628
Plc + GqaGTP \rightleftharpoons PlcGqaGTP \rightarrow PLC+GaqGDP	0.0007	0.7	12	1000		0.0035	51.49	12	18142.4
PlcGqaGTP Ca \rightleftharpoons PlcCaGqaGTP	0.0025	1		400		0.0125	53	12	5200

Two set of Uchigashima simulations were carried out:

1. Uchi_new: Reaction rates from the new MSPN table. Reactions were carried out for 50s.
2. Uchi_updated: Modified reaction rates of the MSPN table where the reactions were speeded up 5 times. K_f was speeded up 5 times and K_b was calculated accordingly. K_{cat} and K_m were kept the same with the exception of $Gqabg + GluMglu \rightleftharpoons GqabgGluMglu \Rightarrow GqaGTP + GluMglu$ reaction, where the K_{cat} was increased so we have $GqaGTP$ available. Reactions were carried out for 70s. Updated rates are in red in table.
3. Calcium comes at 40s.

Plots

100ms depolarization

1 Second Depolarization

5s depolarization

Notes:

1. GqGTP produced is too little in both the github and updated version. The speeding up of 5 times didn't show any significant increase in the production of GqGTP.
2. Active PKC in both Github and Updated is too little and there is almost no difference with changing Dhpg concentration.
3. The amounts of G protein is lower in the github MSPN table compared to the published model, but a large difference is in amount of the G protein present.

Published Model	Github
Gq are 3500 nM mGluR1 is 5000nM	Gs, Gi and Gq are around 2000 nM mGluR1 is 150nM
